CANNED APRICOTS
F.O.B. PRICE RELATIONSHIPS, 1926-27 to 1952-53

Sidney Hoos

Introduction

This report is being issued in response to a request of growers and canners of apricots. The report's objective is to provide the various participants in the canned apricot industries--growers, packers, distributors, and purchasers--with economic and marketing information. Such information, including statistical data on packs, shipments, carry-overs, f.o.b. prices and their relations to the major factors affecting them, is used by the canned apricot industries in the consideration and formulation of marketing policies and programs.

The analysis of f.o.b. price relationships summarized in this report includes several aspects introduced to strengthen the analysis and its results. These aspects may be briefly indicated as follows: The index of competing canned fruit prices has been broadened by adding canned fruit cocktail and canned freestone peaches to the three fruits--canned cling peaches, canned pears, and canned pineapple--previously included in the index. The weights applied to the prices in the index of competing canned fruit prices have been revised to reflect the current relative importance of the various canned fruits. The index of United States nonagricultural income previously used has been replaced by an index of the United States disposable personal income. Finally, the base periods for the index of competing canned fruit prices and for the income index were shifted from 1935-1939 to 1947-1949. Since the details of these changes were discussed in an earlier report,^{2/} they are not discussed further here.

^{2/} Hoos, Sidney, and R. D. Aplin. Canned Apricots, Revised Analyses of F.O.B. Price Relationships. Berkeley, March, 1953. 28p. (Calif. Agr. Exp. Sta. Mimeographed Report No. 147) Processed.

The period covered by this report begins with the 1926-27 marketing season and ends with the 1952-53 season. The war years, 1940-41 through 1945-46, are excluded from the analysis because of the abnormal conditions prevailing then such as price controls; 1946-47 was excluded since a large proportion of canners' shipments that year went into refilling the supply pipe line rather than into consumers' hands.

Results

The f.o.b. prices which reflect the average industry experience during 1952-53 may be summarized as follows:

Canned fruit	Choice No. 2 $\frac{1}{2}$	Average of all grades and sizes
	dollars per case	
California cling peaches	5.32	4.84
California apricots	5.68	4.94
Pacific Coast pears	6.49	5.39
California freestone (Elberta) peaches	5.75	--
California fruit cocktail	6.41	5.56

The price of Hawaiian pineapple (sliced, fancy, No. 2 $\frac{1}{2}$, f.o.b. San Francisco) averaged \$6.85 per case for 1952-53.

The prices for all of the above canned fruits, except pineapple, averaged less in 1952-53 than in the previous marketing year 1951-52 (see Table 3). The increase of 5 cents per case in the pineapple was due to increased transfer costs from Hawaii to San Francisco; the Honolulu price remained unchanged.

The movement of canned fruit from California canners during 1952-53 is given in detail in the appended tables. But the following summary table indicates the high lights:

72 五二五

Canned fruit	Movement from canners	
	Total	Domestic commercial
	thousands of cases; 24 No. 2½ basis	
California cling peaches	16,224	14,519
California apricots	3,910	3,196
Pacific Coast pears	6,199	5,704
California freestone peaches	2,519	2,419
California fruit cocktail	8,698	7,179

In addition, it is estimated that some 12,500,000 cases of pineapple moved into trade channels through packers' and importers' shipments for domestic civilian consumption.

In the 1952-53 season, f.o.b. total domestic commercial shipments of the six canned fruits exceeded the figure of any previous year. There was an increase of as much as 5,000,000 cases above the figure for the previous year (see Table 5). All of the canned fruits, except apricots, shared in the increase; and apricot shipments were only slightly under those of 1951-52. The decrease in f.o.b. prices compared with the previous year, along with the higher level attained by national income, contributed to the increased movement of canned fruits in general.

In addition to providing the basic marketing information summarized above and in the attached tables, this report presents the results of statistical analyses of the major factors which are related to the industry average f.o.b. prices of canned apricots. Such major factors include the domestic commercial movement of canned apricots from California canneries, the level of national disposable personal income, and the relative level of prices of canned fruits competing with canned apricots. Those price-influencing factors are shown in Table 1 appended to this report. The f.o.b. price relationships may be summarized as follows:

A change of 1,000,000 cases (24 No. 2½ basis) in the commercial domestic movement of California canned apricots, considered by itself, was on the average accompanied by a change in the opposite direction of about 41 cents a case in the f.o.b. price (average of all grades and sizes) of canned apricots.

An increase of 10 per cent in the index of disposable income, considered by itself, was on the average accompanied by an increase of about 30 cents a case in the f.o.b. price (average of all grades and sizes) of canned apricots.

A change of 10 points in the adjusted index of prices of competing canned fruits, considered by itself, was on the average accompanied by a change in the same direction of about 18 cents a case in the f.o.b. price (average of all grades and sizes) of canned apricots.

Differences between the actual f.o.b. prices of canned apricots (average of all grades and sizes) and those explained by the statistical analysis are given in Table 2 of this report.

Data

Although the sources of the data on which the report is based are indicated in the footnotes of the various tables, the following supplementary explanations may be noted for the 1952-53 prices, movement data, and other economic information used in the analysis.

The f.o.b. price of canned cling peaches used in this report is an industry average price; it is based on records of canneries and reflects actual operations of the canners packing cling peaches in California. The same is true for the f.o.b. prices for canned apricots and for canned fruit cocktail. The f.o.b. price for canned pears is also an industry average price reflecting actual

A change of 1,000,000 units (100 million) in the
estimated amount of investment in California during 1960
would be a significant increase in the amount of investment
in the state. The amount of investment in the state is
estimated to be about 100 million units in 1960.

The amount of investment in the state is estimated to be
about 100 million units in 1960. The amount of investment
in the state is estimated to be about 100 million units
in 1960. The amount of investment in the state is
estimated to be about 100 million units in 1960.

The amount of investment in the state is estimated to be
about 100 million units in 1960. The amount of investment
in the state is estimated to be about 100 million units
in 1960. The amount of investment in the state is
estimated to be about 100 million units in 1960.

Notes

1. The amount of investment in the state is estimated to be
about 100 million units in 1960. The amount of investment
in the state is estimated to be about 100 million units
in 1960. The amount of investment in the state is
estimated to be about 100 million units in 1960.

experience of the canneries, but the pear price reflects operations of canneries in the Pacific Northwest as well as in California. The canned pear price for the Northwest was made available through the Northwest Cannery Association and that for California was made available through the Cannery League of California. The basic price data for canned apricots were also made available through the Cannery League of California. The basic price data for cling peaches and fruit cocktail were made available through the Cling Peach Advisory Board. The price data for freestone peaches and Hawaiian pineapple are based on published quotations supplemented by trade information.

The 1952-53 prices referred to above and used in the analysis are preliminary. This is so because they reflect industry experience for the 11-month period from June 1, 1952, through April 30, 1953. The trend of market developments during the month of May, 1953, however, suggests that the prices used and given in this report for 1952-53 are representative and indicative of the price experience during the 1952-53 marketing year.

The canner movement data for 1952-53 are preliminary since they include estimates for the final months of the marketing year. For cling peaches and fruit cocktail, the May, 1953, movement was estimated to be equal to that of April, 1953, the latter figure being derived from April 1, 1953, canners' stocks compiled and issued by the Cannery League of California and the May 1, 1953, canners' stocks compiled and issued by the Cling Peach Advisory Board. For apricots and freestone peaches, the movement during each of the months, April and May, 1953, was estimated to be equal to the average monthly movement during the period December, 1952, through March, 1953, and was based on the December 1, 1952, and April 1, 1953, canners' stocks figures compiled and issued by the Cannery League of California. For Pacific Coast canned pears, the procedure was the same as for apricots and freestone peaches but with the California movement data supplemented by that of the Northwest as derived from canners'

stock figures issued and compiled by the Northwest Cannery Association. The movement data for Hawaiian pineapple were derived from trade sources.

The index of United States disposable personal income is based on reports issued by the U. S. Department of Commerce. In the disposable income figures used for 1952-53 in the analysis, it has been necessary to estimate the value for May, 1953, since it has not yet been published; it has been estimated at the level prevailing during the previous month of April, 1953. The level of competing canned fruit prices is measured by an index constructed as indicated in Table 4 appended to this report.

National disposable income advanced during the past year; the figure for 1952-53 is estimated at 242 billion dollars compared with 230 billion dollars in the previous year. The general level of prices of canned fruit competing with canned apricots declined during the year, the decline being reflected in the competing canned fruit prices index which dropped seven points from 88 in 1951-52 to 81 in 1952-53.

the first of these is the fact that the majority of the population of the country is engaged in agriculture, and that the land is held in small parcels.

The second of these is the fact that the majority of the population of the country is engaged in agriculture, and that the land is held in small parcels.

The third of these is the fact that the majority of the population of the country is engaged in agriculture, and that the land is held in small parcels.

The fourth of these is the fact that the majority of the population of the country is engaged in agriculture, and that the land is held in small parcels.

The fifth of these is the fact that the majority of the population of the country is engaged in agriculture, and that the land is held in small parcels.

The sixth of these is the fact that the majority of the population of the country is engaged in agriculture, and that the land is held in small parcels.

Technical Note

With price as the dependent variable and the three other variables below considered as the independent variables, the multiple linear regression equation fitted by the method of least squares to the series covering the years 1926-27 through 1952-53 (excluding 1940-41 through 1946-47) is:

$$X_1 = -10.234814 - \underset{\substack{(2.774669) \\ [-0.287231]}}{0.000413}(X_2) + \underset{\substack{(11.754671) \\ [+1.833337]}}{7.182210}(\log_{10} X_3) + \underset{\substack{(4.934173) \\ [+0.773295]}}{0.018537}(X_4);$$

where:

X_1 is the annual average f.o.b. price (average of all grades and sizes) of California canned apricots (dollars per case), Table 1, column 1.

X_2 is the canners' commercial domestic movement of California canned apricots (in units of 1,000 cases), Table 1, column 2.

X_3 is the index of United States disposable personal income (1947-1949 = 100), Table 1, column 3.

X_4 is the adjusted index of prices of competing canned fruits (1947-1949 = 100), Table 1, column 4.

The figures in parentheses are t-ratios of the net regression coefficients.

The figures in brackets are beta coefficients.

The adjusted coefficient of multiple correlation is $\bar{R}_{X_1, \log_{10} X_3, X_4} = 0.966$.

Abstract

This paper is devoted to the study of the asymptotic behavior of the solutions of the system of equations (1) as $t \rightarrow \infty$. The system is considered in the case when the matrix $A(t)$ is bounded and the vector $b(t)$ is bounded. The asymptotic behavior of the solutions is studied in the case when the matrix $A(t)$ is bounded and the vector $b(t)$ is bounded. The asymptotic behavior of the solutions is studied in the case when the matrix $A(t)$ is bounded and the vector $b(t)$ is bounded.

$$\dot{x} = A(t)x + b(t), \quad x(0) = x_0, \quad (1)$$

where

$A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where

$A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

where $A(t)$ is the matrix of the system, $b(t)$ is the vector of the system, x_0 is the initial vector, t is the time, $x(t)$ is the vector of the system.

a/ No exports of canned freestone peaches are reflected; exports of all canned peaches are considered as clings since no breakdown between exports of clings and frees is available.

b/ Excludes United States government purchases of 200,000 cases (quarter-master). If government purchases were included, total movement would be 2,471,000 cases.

c/ Preliminary; subject to revision.

d/ Excludes United States government purchases of 100,000 cases (quarter-master). If government purchases were included, total movement would be 2,519,000 cases.

1951-52	8,999	--	490	9,488	2,335	7,153	705	5,499 ^b
1952-53 ^c	7,489	0.277	2,335	9,824	1,126	8,698	1,107	7,179 ^d

a/ Movement figures may not be precisely consistent with other figures due to round-
ing.

b/ Excludes United States government (quartermaster) purchases of 949,000 cases. If
government purchases were included, total domestic movement would be 6,448,000
cases.

c/ Preliminary; subject to revision.

d/ Excludes United States government (quartermaster) purchases of 412,000 cases. If
government purchases were included, total domestic movement would be 7,591,000
cases.
